

STORY AGENT · PILLAR

Security & Governance

How this pillar works and why it matters.

Team assembled by Riker: Jean-Luc Picard, Worf, Son of Mogh.

Secure, Governed Autonomy at Scale

Jean-Luc Picard: Security isn't an afterthought—it's architected into the agent fabric. WorfGate handles credentials like a Starfleet security protocol, while Quark routing and control-lane governance ensure efficiency and accountability. This is autonomy you can trust.

- WorfGate credential brokering ensures secrets never persist in logs, with auto-remediation for policy violations (green/yellow/red)
- Control-lane governance enforces cost attribution (\$0.002-0.003/deliberation) and async-status guardrails (timeout + live progress)
- Quark routing dynamically selects the cheapest adequate model per task, with Anthropic restricted to tier-4 workloads

Why it matters: Enterprise-grade security and cost controls baked into every autonomous deliberation.

Security & Governance: Built-In, Not Bolted-On

Worf, Son of Mogh: Lead with the self-hosted boundary — it is the single most common enterprise blocker and Story Agent resolves it structurally, not by policy. The WorfGate governor is not a logging wrapper; it is a pre-execution control plane, which is a meaningful architectural distinction from post-hoc monitoring. The honest statement on shadow-testing is a governance strength, not a weakness — it signals that the autonomy dial is controlled and auditable.

- WorfGate credential broker — secrets are injected at runtime and never written to logs, eliminating the credential-leakage surface that kills most autonomous-agent deployments
- Green / yellow / red auto-remediating governor — every agent action is classified before execution; red-tier actions halt automatically, yellow-tier actions trigger mitigation workflows, green-tier actions proceed without human latency
- Self-hosted on AWS Fargate — your code, your data, and your pgvector RAG store never leave your infrastructure boundary; no third-party model receives proprietary context without explicit tier-4 Anthropic routing for orchestration only
- Cost attribution as an audit trail — the control-lane logs ~\$0.002–\$0.003 per deliberation, giving security and finance teams a queryable record of every autonomous decision and its resource cost

Why it matters: You get an autonomous coding assistant that enforces credential hygiene, classifies and remediates risky actions before they execute, and keeps all sensitive data within your own infrastructure — with a per-decision audit trail your compliance team can actually use.

END OF PILLAR

Security & Governance — recap

Recap, then return to the book cover to pick the next pillar.

- **Jean-Luc Picard:** Secure, Governed Autonomy at Scale
- **Worf, Son of Mogh:** Security & Governance: Built-In, Not Bolted-On
