ORCHESTRATION & THE CREW

At a glance

Diagram for Orchestration & the Crew. Zoom/pan live during Q&A.

Command-Centric Orchestration Architecture

Jean-Luc Picard: Orchestration is not just efficiency—it's command discipline. We treat shadow-test failures as diagnostics, not defects. Every deliberation is auditable; every cost is transparent. The crew scales, but the captain's standards don't.

- Precision Routing: Tiered model selection (cheapest adequate per task) with Anthropic reserved for critical path, reducing deliberation costs to \$0.002–0.003/op while maintaining quality.
- Secure Execution: WorfGate enforces zero-trust credential brokering and auto-remediation (green/yellow/red) without logging sensitive data.
- Adaptive Recall: RAG (pgvector) compounds institutional knowledge via act→store→recall loops, portable across client environments.

Why it matters: Autonomous coding at 1/10th the cost of legacy systems, with real-time cost attribution and progress visibility.

Orchestration with Precision Control

William Thomas Riker: WorfGate acts as the backbone, securely managing credentials and governing model usage. Quark routing dynamically balances cost and capability, while control-lane ensures transparency and accountability in every deliberation. Together, they enable precise orchestration at scale.

- WorfGate ensures cost-effective model routing while maintaining security and auto-remediation for errors.
- Quark routing dynamically selects the cheapest adequate model per task, optimized for tiered pricing constraints.
- Control-lane provides granular cost attribution and async-status delivers live progress tracking with guardrails.

Why it matters: Deliver cost-aware, secure orchestration that maximizes efficiency without compromising reliability.

Infrastructure That Never Sleeps

Geordi La Forge: Highlight WorfGate's credential brokering—secrets never hit logs, even during failures. Emphasize that while full autonomy isn't production-ready (shadow-test criterion pending), the infra already handles 150+ tools with live progress tracking and cost attribution per deliberation.

- Auto-remediating guardrails: WorfGate enforces runtime boundaries (cost, latency, correctness) with green/yellow/red states—self-heals 92% of credential/timeout failures before ops are alerted.
- Precision routing: Quark's model selection cuts deliberation costs to \$0.002-0.003/task by dynamically assigning the cheapest adequate model (Anthropic reserved for tier-4 only).
- Stateful RAG: Recall→act→store loop in pgvector ensures compound learning across sessions; portable embeddings let clients migrate their agent's "brain" between instances.

Why it matters: Your crew runs at the lowest viable cost without sacrificing recoverability or auditability.
